Resources

Here we collect all the texts we recommend and will refer to in the review chapters. If you're wondering why books by Griffiths show up so often, it's likely because he was on the question-writing committee for the Physics GRE exam several years ago. Anecdotally, we know that questions are recycled *very* often (which is why so few exams have been released), so it's likely that many of the questions you'll see on your exam were written by Griffiths or consciously modeled after his books.

- **Classical Mechanics:** Whatever book you learned freshman physics from should suffice here. For a more in-depth review of advanced topics, try *Classical Dynamics of Particles and Systems* by Thornton and Marion.
- **Electricity and Magnetism:** D.J. Griffiths, *Introduction to Electrodynamics*. This book covers everything you'll need to know about electricity and magnetism on the GRE, *except* for circuits. For circuits and a review of the most basic electricity and magnetism problems which Griffiths glosses over, consult any standard freshman physics textbook. A good treatment of electromagnetic waves can also be found in R.K. Wangsness, *Electromagnetic Fields*. E. Purcell, *Electricity and Magnetism* is an extremely elegant introduction emphasizing physical concepts rather than mathematical formalism, should you need to relearn the basics of any topic. And by no means should you consult Jackson! It's far too advanced for anything you'll need for the GRE.
- **Optics and Waves:** Like classical mechanics, nearly all the relevant information is covered in your freshman physics textbook. Anything you're missing can be found in the relevant chapters of *Introduction to Electrodynamics* by Griffiths.
- **Thermodynamics and Statistical Mechanics:** No overwhelming recommendation here. *Thermal Physics* and *Elementary Statistical Physics* by Kittel, or *Fundamentals of Statistical and Thermal Physics* by Reif, are decent. *Statistical Physics*, by F. Mandl has some decent pedagogy and the nice feature of many problems with worked solutions. Fermi's *Thermodynamics* is a classic for the most basic aspects of the subject.
- **Quantum Mechanics and Atomic Physics:** D.J. Griffiths, *Introduction to Quantum Mechanics*. This is really the only reference you need, even for atomic physics questions. Shankar and Sakurai are serious overkill, stay away from them for GRE purposes!

- **Special Relativity:** Chapter 12 of *Introduction to Electrodynamics* by Griffiths, and Chapter 3 of *Introduction to Elementary Particles*, also by Griffiths, for more examples of relativistic kinematics. Note that confusingly, the two books use different signatures for the metric, so be careful!
- **Laboratory Methods:** An excellent general reference is *Radiation Detection and Measurement* by Glenn Knoll. Chapter 1 covers general properties of radiation, Chapters 2 and 4 cover interactions of radiation with matter, Chapter 10 covers photon detectors, and Chapter 3 covers precisely the kind of probability and counting statistics you'll be asked about on the GRE. The rest of that book goes into far more detail than necessary, so don't worry about it. For lasers, try O. Svelto, *Principles of Lasers*, Chapters 1 and 6.
- **Specialized Topics:** The first chapter of D.J. Griffiths, *Introduction to Elementary Particles*, is a *mandatory* read. It seems that every GRE in the last three years has contained at least one question which can be answered purely by picking facts out of this chapter. The rest of the book is pretty good too, but the later chapters are almost certainly too advanced for the GRE. For condensed matter, try *Introduction to Solid State Physics* by Charles Kittel.
- **All-around:** Kirkby's *Physics: A Student Companion* is a nice all-around summary of a wide range of physics topics. It's geared toward students studying for exams, so it is concise and more distilled than the subject-specific books.

There are also several useful websites containing information related to the Physics GRE:

- www.grephysics.net: A compilation of the 400 problems released by ETS prior to 2011, and student-contributed solutions.
- www.physicsgre.com: A web forum for discussion of issues related to the GRE, and the grad school application process in general. Highly recommended: one of us (Y.K.) met several future colleagues on this forum before meeting them in person.

Finally, we encourage you to check our website, www.physicsgreprep.com, on a regular basis as we will be uploading errata and revisions as needed. Good luck!
